¹ U-Factor - measures the rate of heat transfer. The lower the U-factor the better the window insulates.

² SHGC (Solar Heat Gain Coefficient) a fraction of solar radiation admitted through a window and subsequently released as heat inside a home. Higher SHGCs are preferable in Northern climates; while lower SHGCs are preferable for Southern climate zones.

³ VT (Visible Light Transmittance) measures the amount of visible light that passes through a window. A high VT transmits more visible light into the home making it brighter from natural light.

⁵ Go to www.energystar.gov for more details on the Federal Energy Tax Credit and ENERGY STAR.

⁶ CRF (Condensation Resistance Factor) measures how well the window resists water build-up from inside the home. The higher the condensation resistance factor, the less moisture build-up the window allows.

⁷ Approved in qualifying zone.

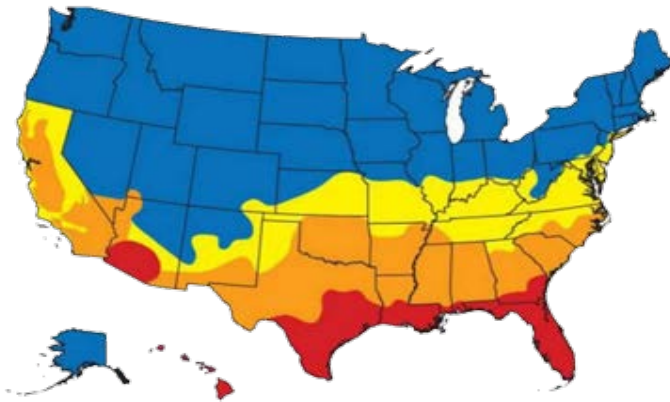

¹⁰ **All values determined utilizing 2.3 mm single strength glass panes. Patio Door values determined with tempered double strength 3.1 mm glass panes.**

Values can vary depending on use of different glass thicknesses, special grids, tempered glass and other glass options and sash/frame structural reinforcement.

Other thermal values are possible by special glazing, framing and grid applications. Consult Interstate.

* Not responsible for typographical errors. Values subject to change without notice.

ENERGY STAR 2022 Recognition Criteria Residential Windows and Sliding Glass Doors (SGD)

- **Northern**
- **North-Central**
- **South-Central**

North-Central ■	≤ 0.20	≤ 0.40
South-Central ■	≤ 0.20	≤ 0.25
South ■	≤ 0.20	≤ 0.25

When Only the Best Will Do

The Environmental Protection Agency introduces **ENERGY STAR Most Efficient 2022**, a distinction that recognizes products that deliver cutting edge energy efficiency along with the latest technological
